Document #: 90-000548

Important Safety Notice

The 8028 SIP Doorphone is designed and tested to comply with EN 60950-1:2006 safety requirements.

When the Doorphone Controller is connected to wiring that exits the building, there is potential risk of lightning induced electrical surges or high voltages from fault conditions. To reduce risk, outdoor wiring should be protected by Earth grounded conduit whenever possible.

If outdoor wiring will be connected to the Doorphone Controller then the power supply provided with the Doorphone Controller must first be connected to a properly Earthed mains supply. Under no circumstances can the Doorphone Controller be disconnected from Earth ground while connected to outdoor wiring.

Support

Algo is pleased to offer telephone or email support relating to installation issues, applications assistance, or general product inquiries.

Algo products are warranted against defect in workmanship for a period of 12 months after installation not to exceed 18 months from date of manufacture.

FCC Compliance

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: 1) Reorient or relocate the receiving antenna, 2) Increase the separation between the equipment and receiver, 3) Connect the equipment into an outlet on a circuit different from that to which the receiver is connected, or 4) Consult the dealer or an experienced radio/TV technician for help.

Introduction

Ideal for secure business entrances, emergency intercom, and residential gates, Algo's 8028 SIP Doorphone provides hands-free intercom capability, entrance security with door unlock control, rugged weatherproof design, and superior audio performance.

Fully compatible with SIP industry standards, the 8028 SIP Doorphone will work with most hosted or enterprise SIP-based servers supporting third-party SIP endpoints.

The 8028 Doorphone includes a Control Unit, Door Station, and Power Supply. The Control Unit and Door Station can be connected with a single twisted pair wire up to 1,000 feet (300 m) with the Door Station located outdoors and the Control Unit in a dry indoor location.

Features

- Suitable for commercial or residential applications
- Door Station connected by a single twisted wire pair
- Full duplex capable hands-free voice communication at the Door Station
- Door control relay contacts and available 24 Vdc 0.3 A strike power
- Auxiliary dry contact inputs and outputs from Doorphone Controller and Door Station
- Programmable via Web Interface
- International 110/220 V, 50/60 Hz switching power supply
- Regulatory: CSA/UL, FCC Class B, CE, EN60950-1 2006 CB Scheme

Quick Install & Test

The 8028 SIP Doorphone requires minimal configuration for a typical installation. Programming is only required to enter the SIP account details, and for more advanced applications.

1. Connect the power supply to the Power Jack of the Doorphone Controller and plug into an available AC outlet.
2. Flush or surface-mount the Digital Door Station at desired location and connect a twisted telephone wire pair between the "CTRL" terminals of the Door Station and the center pair (red and green) of the supplied Telephone Wiring Jack. Polarity is not important.
3. Using the short six conductor modular cable, connect the Telephone Wiring Jack to the Door Station Jack of the Doorphone Controller.
4. Using an Ethernet cable, connect the Ethernet Jack of the Doorphone Controller to your LAN.
5. Press the Call Button on the Door Station. A recorded voice will speak the IP Address of the device. Enter this address in a PC web browser in order to open the Web Interface. Note: The spoken IP address feature will be automatically disabled after a SIP Server is configured in Step 6 (below).
6. Use the Web Interface to enter the SIP Proxy Server address as well as the user account and password that the 8028 SIP Doorphone will use to register. Also enter the target extension that the Doorphone will call.
7. Press the Call Button on the Door Station, then answer to communicate with the Door Station. Press the digit 6 on the phone keypad to activate the door control relay for three seconds (if applicable).

Applications

Typical Applications for Auxiliary Inputs and Outputs

The 8028 architecture and digital link between the Door Station and Controller provides flexible options using the auxiliary inputs and outputs. These are some typical applications:

Cancel Ring When Door Opened

In a residential or warehouse installation it is not uncommon for the door to be answered in person before the phone is answered. Either Door Station or Control Unit inputs can be configured to cancel ring if the door is opened before a call is answered. This requires a normally closed or normally open contact to detect door open.

Trigger Door Bell from Door Station

When the Door Station call button is pressed, either (or both) the Door Station or Control Unit dry contact output can be configured to activate a door bell or auxiliary alerting system in addition to phone ring.

Trigger Door Station from External Button/Event

Either the Control Unit or Door Station can accept a dry contact closure to activate the Doorphone as if the call button had been pressed. This could be an external doorbell button, PIR detector, or some other system.

Cancel Door Open Relay once Door Opened

The door opening control can be set for activation (using the 'Open Code') up to 30 seconds (set by the 'Relay Time' setting) to allow sufficient time for entry. For security, the 8028 Doorphone can be configured to cancel Door Opening once the door is opened to prevent "tailgating" by unauthorized personnel.

Unlock Door Indefinitely until Canceled

The door opening control can be set to unlock indefinitely (using the 'Latch Open Code') until canceled (using the 'Release Code') that locks it again. This allows an entrance to be used repeatedly for a period of time without requiring multiple activations of the door control relay.

Anti-Door Tamper

A feature of the 8028 Doorphone is to ring the telephone(s) with a warning alert in the event a door is ajar due to tampering (such as a door blocked open after being legitimately released for a visitor).

In-Use and Ring

Either the Control Unit or Door Station can be configured to provide a dry contact output during ring or in-use for channel selection (typically) of third party video monitoring systems.

Door or Gate Control Basics

Control contacts are provided from the Doorphone Controller and are typically used for door strike activation or gate control. For security, the door control relay is located in the Controller to avoid entry by tampering. The Door Station dry contact output (OUT) may be configured for 'low security' gate control requiring a low current dry contact.

Door Release

Door release typically involves energizing or de-energizing a door strike which pivots to allow a locked door to open without retraction of the latch bolt. There are two different types of door strikes:

- "Fail Locked" (or "Fail Secure")
- "Fail Unlocked" (or "Fail Safe")

Fail Locked / Fail Secure Electric Strike

These require power to release and remain locked during power failure. The door may still normally be opened from the outside with a key, or from inside without a key. The door control relay is used to apply power to release the door.

Fail Unlocked / Fail Safe Electric Strike

These (as well as magnetic locks), require power to lock and become unlocked during power failure. The door control relay is used to maintain power to the door lock (NC and C contacts) which is interrupted to release the door. Magnetic locks may require override systems to allow safety exit in the event of fire.

Power Supply

The Doorphone Controller provides an auxiliary 24 V 0.3 A power supply which is suitable for common types of door strikes. If more current or a different voltage is required, then the customer must provide a matching power supply for the electric strike or magnetic lock. Maximum switching capability of the door control contacts is 1 A 30 V.

The Door Control relay may also be configured for alternate functionality including In-Use, Ring, and Call Button Press.

For more information on applications for the 8028 SIP Doorphone, please visit www.algosolutions.com/8028. The 8028 Doorphone firmware may be modified through the web interface and Algo routinely accepts requests for custom firmware for unique applications.

Setup and Installation

8028 SIP Doorphone Controller

Programming and Configuration

Connection to Network and Obtaining IP Address

After connecting the 8028 to a network port, watch for the PWR light to start winking (on and blinking off) during initialization. The 8028 will then attempt to obtain an IP address from the DHCP server. If unsuccessful, the 8028 will default to the fixed IP address 192.168.1.111.

To find the IP address of the 8028, press the Call Button on the Door Station. The 8028 will speak its IP address if it has not yet been configured with a SIP Server address. Alternatively, search the network using the 8028 Locator Tool available for download from www.algosolutions.com/8028locator.

Web Interface Control Panel

The 8028 is programmed using a web interface tool accessed by entering the 8028 IP address into a browser. Using this interface, you can configure the 8028 network settings and select the desired options. These settings survive power cycling and may be programmed in advance prior to site installation.

Configuration Options

SIP

<input type="checkbox"/> SIP	
<input type="checkbox"/> SIP Domain/Proxy <input type="text"/>	
Outbound Proxy (optional)	<input type="text"/>
STUN Server (optional) 	<input type="text"/>
Registrar (optional)	<input type="text"/>
Register Period (seconds)	<input type="text" value="3600"/>
Keep-alive Method	<input checked="" type="radio"/> None <input type="radio"/> Double CRLF
Keep-alive Period (seconds)	<input type="text"/>
<input type="checkbox"/> Extension	<input type="text"/>
Auth ID	<input type="text"/>
Password	<input type="text"/>
Dialing Extension	<input type="text"/>

SIP Domain/Proxy	SIP Server Name or IP address
Outbound Proxy (optional)	Outbound proxy is a proxy (server) that stands between a private network and the Internet.
STUN Server (optional)	Allow communication between SIP server and 8028 if NAT is present (see "NAT" on page 19).
Registrar (optional)	A registrar is a server that accepts REGISTER requests from SIP devices. Configure Registrar if the SIP Proxy does not accept REGISTER requests.
Register Period (seconds)	Maximum requested period of time where the 8028 will re-register with the SIP server. Default setting is 3600 seconds (1 hour). Only change if instructed otherwise.
Keep-alive Method	Maintain connection between the 8028 and the SIP Server if the 8028 is behind NAT.
Keep-alive Period (seconds)	Period of time where the 8028 will send some information to the SIP Server to keep the connection alive.
Extension	The phone number that the 8028 registers with the SIP Server. It will auto-answer any inbound calls.
Auth ID	Authentication ID; Used to register the device on the SIP Server.
Password	SIP password used to register the device on the SIP Server.
Dialing Extension	Phone number to be dialed when the Call button on the door station is pressed.

VLAN ID(0~4094)

VLAN Priority(0~7)

Advanced Settings

DHCP Timeout (seconds)

60

NTP Server

DHCP	Dynamic Host Configuration Protocol (DHCP) is an IP standard designed to make administration of IP addresses simpler. Normally set to On, DHCP will automatically configure IP addresses for each 8028 on the network. Alternatively, if your IT Administrator has assigned one or more <i>static</i> IP addresses, set the DHCP setting to Off.
VLAN Support	VLAN Tagging (or IEEE 802.1Q) allows sharing of a physical network link by multiple independent networks.
VLAN ID	A 12-bit field specifying the VLAN to which the frame belongs. A value of 0 means that the frame does not belong to any VLAN. The hexadecimal values of 0x000 and 0xFFF are reserved. All other values may be used as VLAN identifiers, allowing up to 4094 VLANs.
VLAN Priority	Priority Code Point (PCP): a 3-bit field which refers to the IEEE 802.1p priority. Values are from 0 (best effort) to 7 (highest); 1 represents the lowest priority.
DHCP Timeout (seconds)	Length of time following a request from an 8028 to the DHCP server that the 8028 will wait before assuming the server is not available. After such time, the 8028 will use its default address (192.168.1.111). Default timeout is 60 seconds.
NTP Server	Network Time Protocol server IP address. Allows device to automatically set its clock by connecting to an external server.

100

Log Method

☒ Local ☐ Network ☐ Both

Log Server IP

Device Name	Name to identify the device in the Algo Network Device Locator Tool.
Password	<p>Password to log into the 8028 web interface.</p> <p>You should change the default password in order to secure the device on the network. If you have forgotten your password, a soft reset will restore the default setting (including <i>all</i> of the device's default settings). To do this, first disconnect power from the 8028 Doorphone Controller. Then press and hold the Reset button on the back of the device, and while doing this, reconnect the power. Continue to hold the Reset button until the LEDs on the front of the controller start to flash.</p>
Provisioning	See "Auto-Provisioning (via TFTP)" on page 20.
Log Level	Amount of information provided in the log files. This value should only be changed if advised by Algo.
Log Size	Amount of internal memory reserved for recording log file. Default is 100 kB.
Log Method	Sets storage location of log file data. Default setting is Local. Choose Network (or Both) to send log messages to any "Syslog" server, an option to prevent loss of data during a powerdown.
Log Server IP	IP address of Log Server if Log Method is set to Network or Both. Format: #.#.#.#

NAT

NAT (Network Address Translation) is located between a private network and the Internet. When properly configured, it allows an 8028 installed on a private network to have access to the outside world, such as would be required when using a hosted SIP provider (i.e. a SIP server that is remotely located).

Also provides NAT support for both STUN and Asterisk. To configure NAT for the server that applies to your application, follow these steps:

STUN Server

1. Enter the STUN Server name or IP address
2. Set Keep-alive Method to None
3. Click Save Settings

The screenshot shows the 'SIP' configuration tab. The 'SIP Domain/Proxy' is set to '10.0.0.10'. The 'Outbound Proxy (optional)' field is empty. The 'STUN Server (optional)' is set to '10.0.0.30'. The 'Registrar (optional)' field is empty. The 'Register Period (seconds)' is set to '3600'. The 'Keep-alive Method' is set to 'None' (selected with a radio button). The 'Keep-alive Period (seconds)' is set to '30'.

Asterisk and other SIP Servers

1. Set Keep-alive Method to Double CRLF
2. Set Keep-alive Period to 30
3. Click Save Settings

The screenshot shows the 'SIP' configuration tab. The 'SIP Domain/Proxy' is set to '10.0.0.10'. The 'Outbound Proxy (optional)' field is empty. The 'STUN Server (optional)' field is empty. The 'Registrar (optional)' field is empty. The 'Register Period (seconds)' is set to '3600'. The 'Keep-alive Method' is set to 'Double CRLF' (selected with a radio button). The 'Keep-alive Period (seconds)' is set to '30'.

The NAT library sends the binding requests for each port every 30 seconds to ensure NAT mapping is valid all the time.

Auto-Provisioning (via TFTP)

Auto-provisioning allows installers to pre-configure 8028 units prior to installation on a network. It is typically used for large deployments.

If desired, 8028 configuration files can be automatically downloaded from a TFTP (Trivial File Transfer Protocol) server using DHCP Option 66. Option 66 is a term used by some DHCP vendors to describe DHCP code 66. This option code (when set) supplies a TFTP boot server address to the DHCP client to boot from.

DHCP must be enabled in order to use DHCP Option 66 for auto-provisioning.

FTP and HTTP protocols are also supported, as well as a static Provisioning Server address instead of DHCP Option 66.

One of two files can be uploaded on the TFTP server:

- generic file *algot8028.conf*, or
- specific file *algot[MAC_Address].conf*

If “Prov. Download Path” is defined as Prov_Path (by default it’s empty), and “Prov. Download Method” is set to TFTP, the device will download configuration files from these URLs:

`tftp://Prov_Server/Prov_Path/algot[MAC_Address].conf`

`tftp://Prov_Server/Prov_Path/algot8028.conf`

MD5 Checksum

In addition to the .conf file, an .md5 checksum file must also be uploaded to the TFTP server. This checksum file is used to verify that the .conf file is transferred correctly without error.

A tool such as can be found at <http://www.fourmilab.ch/md5> may be used to generate this file.

Generating a generic configuration file

1. Connect an 8028 on the network
2. Access the 8028 web interface
3. Configure the 8028 with desired options
4. Click on the Services tab and then on Backup Settings
5. Save the file *settings.txt*
6. Rename file *settings.txt* to *algop8028.conf*
7. File *algop8028.conf* can now be uploaded on the TFTP server

If using a generic configuration file, extensions and credentials have to be entered manually once the 8028 has automatically downloaded the configuration file.

Generating a specific configuration file

1. Follow steps 1 to 5 as listed in the section “MD5 Checksum” on page 20.
2. Rename file *settings.txt* to *algom[MAC_Address].conf*
(e.g. *algom0022EE020009.conf*)
3. File *algom[MAC_Address].conf* can now be uploaded on the TFTP server.

The specific configuration file will only be downloaded by the 8028 with the MAC address specified in the configuration file name. Since all the necessary settings can be included in this file, the 8028 will be ready to work immediately after the configuration file is downloaded. The MAC address of each 8028 can be found on the back label of the unit.

Connections and Lights

Auxiliary Dry Contact Outputs

Both the Doorphone Controller and Door Station provide a dry contact output for connection to auxiliary devices. Maximum switching capacity is 30 V 50 mA.

Default operations are as follows:

- Doorphone Controller Output = In-Use (commonly used for camera control)
- Door Station Output = Call Button Press (commonly used to activate a secondary door bell)

Other options for Doorphone Controller output include Ring and Call Button Press. Other options for Door Station output include In-Use and Door Control.

Auxiliary Dry Contact Inputs

Both the Doorphone Controller and Door Station can detect a dry contact closure from auxiliary devices. A non-capacitive and non-inductive low voltage and low current is used to detect contact closure.

Default operations are as follows:

- Doorphone Controller input = Door Sensor Normally Closed (used to detect door open)
- Door Station input = Call Button Normally Open (used to detect external doorbell switch)

Options for Doorphone Controller input include Door Sensor Normally Closed, Door Sensor Normally Open, Manual Door Release, Door Control Lockout, Call Button Normally Closed, and Call Button Normally Open.

Options for Door Station input include Door Sensor Normally Closed, Door Sensor Normally Open, Call Button Normally Closed, and Call Button Normally Open.

See "Configuration Options" on page 12 for more information on setting up auxiliary inputs and outputs.
